Stroke is defined as an acute neurologic deficit lasting >24 hours and caused by cerebrovascular etiology. It is further

subdivided into ischemic stroke (caused by vascular occlusion or stenosis) and hemorrhagic stroke (caused by vascular rupture, resulting in intraparenchymal and/or subarachnoid hemorrhage).

#### **Stroke - Wikipedia**

A stroke is a medical condition in which poor blood flow to the brain results in cell death. There are two main types of stroke: ischemic, due to lack of blood flow, and hemorrhagic, due to bleeding. They result in part of the brain not functioning properly. Signs and symptoms of a stroke may include an inability to move or feel on one side of

#### **let's talk about Ischemic Stroke - Stroke Association**

**Ischemic Stroke** The majority of strokes occur when blood vessels to the brain become narrowed or clogged with fatty deposits called plaque. This cuts off blood flow to brain cells. A stroke caused by lack of blood reaching part of the brain is called an ischemic stroke. High blood pressure is a leading risk factor for ischemic stroke that you can change. An ischemic stroke occurs when a clot

#### **Pathophysiology of ischemic stroke - UpToDate**

The term ischemic stroke is used to describe a variety of conditions in which blood flow to part or all of the brain is reduced, resulting in tissue damage. Although in some cases this may be a chronic condition, most strokes occur acutely. Research over the last four decades has resulted in a
